Test Report

Test Name	Results	Units	Bio. Ref. Interval
ALLERGY COMPREHENSIVE PROFILE (ImmunoCAP,FEIA)			
ALLERGY SCREEN			
Phadiatop,IgE		kUA/L	<0.35
Immunoglobulin IgE, Serum		kUA/L	<64.00
ALLERGY PANELS			
Dust Panel			
Food Panel			
Animal Panel			
Mold Panel			
Grass Panel			
Weed Panel			
Tree Panel			
ALLERGEN SPECIFIC IgE, QUANTITATIVE			
Dust Panel			
House dust		kUA/L	<0.35
Cockroach		kUA/L	<0.35
Dermatophagoides pteronyssinus		kUA/L	<0.35
Dermatophagoides farinae (House Dust mite)		kUA/L	<0.35
Food Panel			
Chicken (Gallus spp.)		kUA/L	<0.35

Name	: **DUMMY**

Test Report

Test Name	Results	Units	Bio. Ref. Interval
Acacia longifolia		kUA/L	<0.35
Ulmus Americana (Elm)		kUA/L	<0.35
Mesquite (Prosopis juliflora)		kUA/L	<0.35
Melaleuca (Melaleuca leucadendron)		kUA/L	<0.35

Note

- In vitro allergy tests are a valuable tool for the clinician to diagnose allergy, treat and predict disease development.
- Allergy panels / Allergen specific IgE includes only common causative allergens and does not include all possible allergens.
- In cases of food allergy, specific IgE antibodies may be undetectable inspite of a convincing clinical history because these antibodies may be directed towards allergens that are revealed or altered during industrial food processing, cooking or digestion and therefore do not exist in the original food for which the patient is tested.
- Normal IgE levels do not necessarily exclude the possibility of allergy because certain allergies can be non-IgE mediated.
- Very low levels of allergen specific IgE antibodies should be evaluated with caution when Total IgE values exceed 100 kUA/L
- All results should be interpreted in relation to the individual case history.

Comments

Genetic factors in development of Allergic disease

Family history of allergic disease	Percentage risk
No family member allergic	5-15
One sibling allergic	25-35
One parent allergic	20-40
Both parents allergic	40-60
Both parents allergic with same symptoms	50-70

Name	: **DUMMY**				
Lab No.	: **NS00166**		**Age**	: **47 Years**

MC-2113

Test Report

Test Name	Results	Units	Bio. Ref. Interval

Immunoglobulin E (IgE): The most important trigger molecule for allergic information. The level of IgE is low during the first year of life, gradually increases with age and reaches adult levels after 10 years. As IgE is a mediator of allergic response, quantitative measurement can provide useful information for differential diagnosis of atopic and non-atopic disease. Patients with atopic diseases like Allergic asthma, Allergic rhinitis & Atopic dermatitis have moderately levated IgE levels

Increased Levels - Atopic/Non-atopic allergy, Hyper IgE syndrome, Parasitic infections, IgE Myeloma, Pulmonary Aspergillosis, Immunodeficiency states & Autoimmune diseases

Uses

- Evaluation of children with strong family history of allergies and early clinical signs of disease
- Evaluation of children and adults suspected of having allergic respiratory disease to establish the diagnosis and define the allergens
- To confirm clinical expression of sensitivity to foods in patients with Anaphylactic sensitivity or with Asthma, Angioedema or Cutaneous disease
- To evaluate sensitivity to insect venom allergens particularly as an aid in defining venom specificity in those cases in which skin tests are equivocal
- To confirm the presence of IgE antibodies to certain occupational allergens

Allergy Panels: are reported as qualitative values for the broad identification of commonly associated allergens

Allergen Specific IgE Interpretation

QUANTITATIVE RESULT IN kUA/L	LEVEL OF ALLERGEN SPECIFIC ANTIBODY	SYMPTOM RELATION
<0.10	Undetectable	Unlikely
0.10-0.50	Very low	Uncommon
0.50-2.00	Low	Low
2.00-15.00	Moderate	Common
15.00-50.00	High	High
50.00-100.00	Very High	Very High
>100.00	Very High	Very High

Name	: **DUMMY**
